

Label your objects with Roboflow

1. Create an account in Roboflow

Roboflow: Computer vision tools for developers and enterprises

Everything you need to build and deploy computer vision models, from automated annotation tools to high-performance deployment solutions.

 <https://roboflow.com/>

2. Select “New Project”

A purple button with a white plus sign and the text 'New Project'.

3. Upload and annotate your images (drawing a bounding box and assigning a label). You can label multiple objects in a single image.

Prepare your data for **Custom Training**

+ New Dataset Version

⚡ Train Model ▾

Roboflow Instant Model

Fine-tune a new Roboflow Instant model on all training and validation images from the project dataset.

Custom Training

Create a dataset version with custom preprocessing, augmentations, and select a model type for training.

Upload Custom Weights

Upload your own custom-trained model weights to Roboflow.

4. Go to “Projects” and click on your project.

⋮

Make sure you have balanced the `train`, `test`, and `validation` images (the following image is just an example with a reduced dataset, it is recommended to have as many images as you can).

Rebalance Train/Test Split

You can update your dataset's **train/test split** here.

Note: changing your test set will invalidate model performance comparisons with previously generated versions.

Save

5. Configure the preprocessing steps (if required)

Rotation

Add variability to rotations to help your model be

6. Click on “Create” to create your database

5

Create

Review your selections and select a version size to create a moment-in-time snapshot of your dataset with the applied transformations.

Larger versions take longer to train but often result in better model performance. [See how this is calculated](#) ↗

Maximum Version Size

12 images (3x) 

Version Notes:

Add any version notes here...
